

Baby Boom

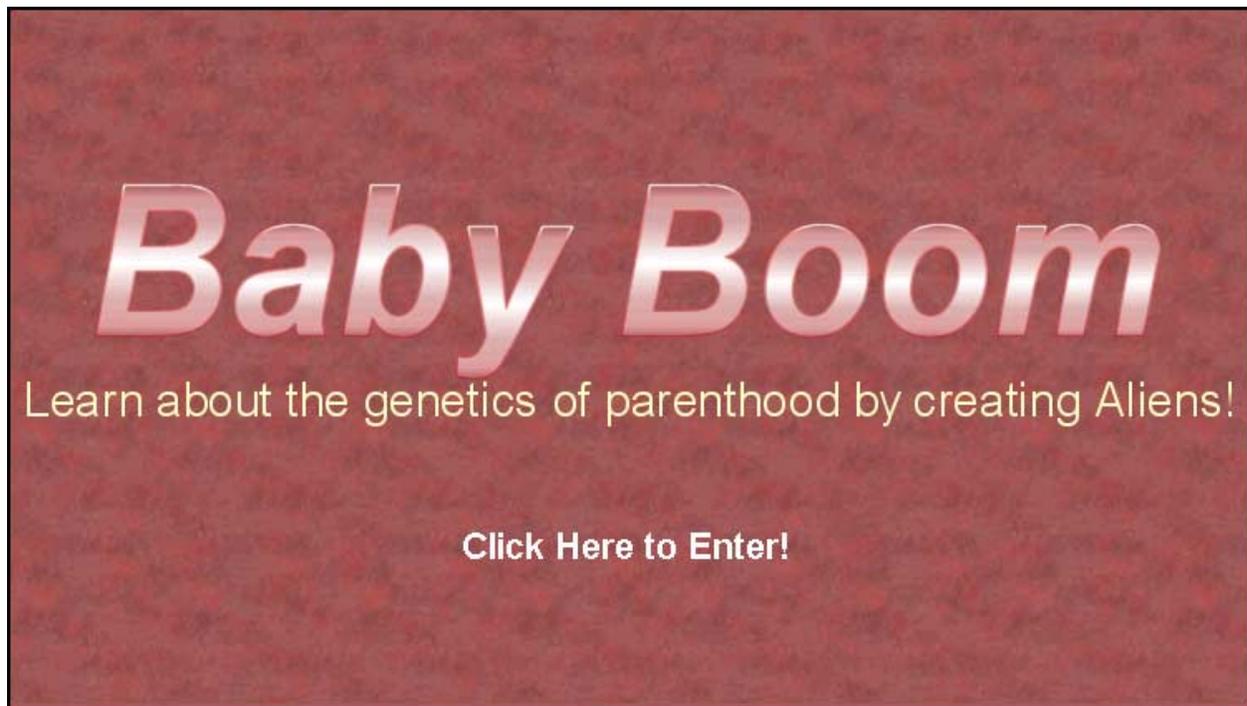

This web lab was adapted from materials from Joan Carlson, Jack Doepke, Judy Jones and Randyll Warehime.

Background

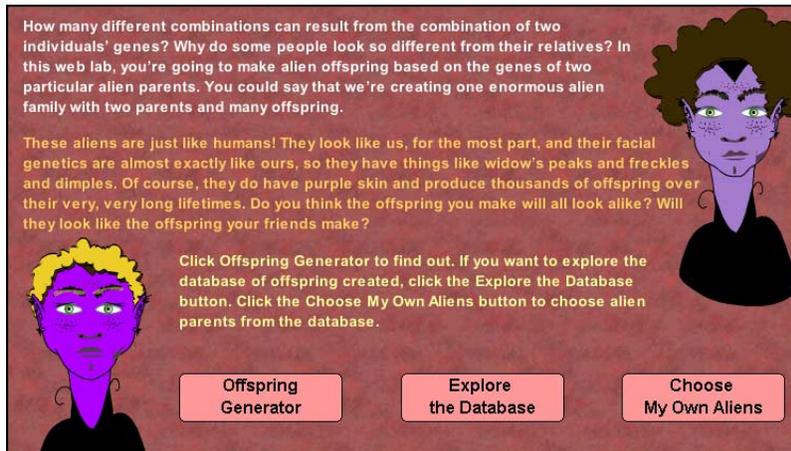

In this web lab, students explore how much variety in phenotype can be produced by a very limited genotype (only 30 traits). The traits in this web lab show several different inheritance patterns. These inheritance patterns are simplified representations of real inheritance patterns. The traits in the aliens in this web lab show the following inheritance patterns:

- ◆ Dominant – Traits that appear to mask (or hide) other traits.
- ◆ Recessive – Traits that can be hidden in one generation and then appear in the next.
- ◆ Incomplete dominance – Traits in which the heterozygote shows a different phenotype from the homozygous dominant phenotype.
- ◆ Polygenic – Traits in which several genes contribute to the overall phenotype.
- ◆ Epistasis – The interaction of two genes in which one hides the effects of another.

The Web Lab

Introduction

How many different combinations can result from the combination of two individuals' genes? Why do some people look so different from their relatives? In this web lab, you're going to make alien offspring based on the genes of two particular alien parents. You could say that we're creating one enormous alien family with two parents and many offspring.

These aliens are just like humans! They look like us, for the most part, and their facial genetics are almost exactly like ours, so they have things like widow's peaks and freckles and dimples. Of course, they do have purple skin and produce thousands of offspring over their very, very long lifetimes. Do you think the offspring you make will all look alike? Will they look like the offspring your friends make?

Click Offspring Generator to find out. If you want to explore the database of offspring created, click the Explore the Database button. Click the Choose My Own Aliens button to choose alien parents from the database.

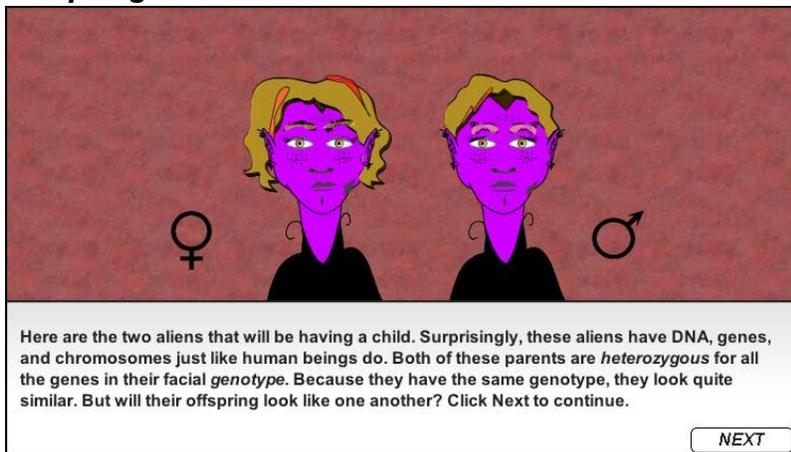

Offspring Generator Explore the Database Choose My Own Aliens

The text on this screen reads, "How many different combinations can result from the combination of two individuals' genes? Why do some people look so different from their relatives? In this web lab, you're going to make alien offspring based on the genes of two particular alien parents. You could say that we're creating one enormous alien family with two parents and

many offspring. These aliens are just like humans! They look like us, for the most part, and their facial genetics are almost exactly like ours, so they have things like widow's peaks and freckles and dimples. Of course, they do have purple skin and produce thousands of offspring over their very, very long lifetimes. Do you think the offspring you make will all look alike? Will they look like the offspring your friends make? Click Offspring Generator to find out. If you want to explore the database of offspring created, click the Explore the Database button. Click the Choose My Own Aliens button to choose alien parents from the database."

By choosing the *Offspring Generator* button, students will create their own alien offspring by flipping a coin to determine which alleles that offspring will inherit from its parents. The *Explore the Database* button will allow students to explore graphs of the numbers of aliens in the database of 100 aliens by genotype and phenotype. The *Choose My Own Aliens* button will allow students to examine the traits of the 100 aliens in the database and choose two different parents for their offspring.

Offspring Generator

Here are the two aliens that will be having a child. Surprisingly, these aliens have DNA, genes, and chromosomes just like human beings do. Both of these parents are *heterozygous* for all the genes in their facial *genotype*. Because they have the same genotype, they look quite similar. But will their offspring look like one another? Click Next to continue.

NEXT

In this section of the web lab, students flip a coin to determine the traits that their alien offspring will inherit. The alien parents are both heterozygous for all the genes in their facial genotype.

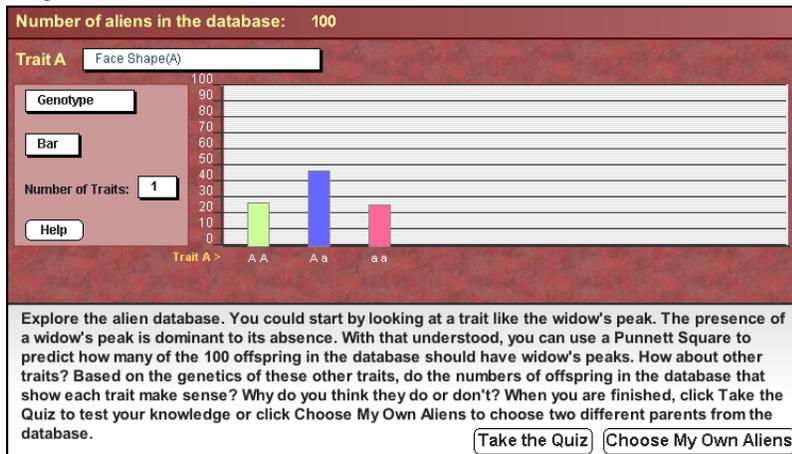

The first coin flip determines whether the offspring inherits an X or a Y chromosome from the father and, thus, determines the offspring's sex. Students then determine the thirty traits

in the facial phenotype by flipping a coin for each allele inherited from the parents. Some of the traits are polygenic, so more than thirty flips are required to complete the offspring. As the student progresses through, the picture of the alien face is filled in. After a trait is determined by coin flips, the *Show Trait/Hide Trait* button appears below the picture of the offspring. If a

student misses the appearance of a trait, he or she can hide the trait, then show it again to see how the alien face changes. The table at the end of this document shows the various phenotypes and genotypes that the aliens can display. After flipping the coin to determine the traits of one alien offspring, students may want to use the *Finish Alien >>* button to complete subsequent offspring. The *Finish Alien >>* button randomly determines the alleles contributed by each parent.

After students have completed their alien offspring, they can print out the image and the genotype. They can use the printouts to compare offspring with their classmates and get a feel for the variety that can be produced by just 30 separate traits.

Explore the Database

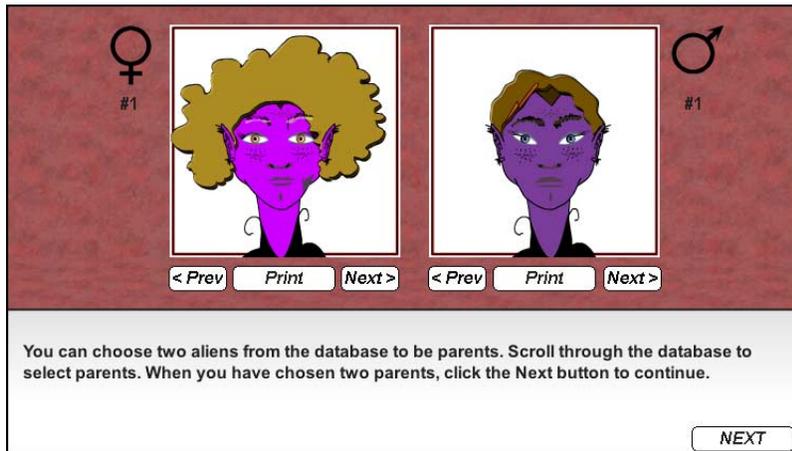

In this section of the web lab, students can query the database of 100 alien offspring to see what traits appear and how frequently. Students select which trait or traits they would like to see displayed on the graph using the pulldown menu labeled Trait A. They can then choose whether they would like the graph to present genotype or phenotype, whether they want a bar or a pie chart, and

how many traits they would like to see displayed (1 or 2). If they choose to display two traits at a time, the graph displays only phenotypes. Numerical values for each bar are displayed when the cursor is positioned over a bar.

In this section, students can use the graphs to determine whether a trait follows a particular model of inheritance. For example, simple dominant/recessive traits should show a 3:1 ratio of dominant to recessive phenotypes, while incompletely dominant traits show a 1:2:1 ratio. Students can use Punnett Squares to determine expected ratios, then query the database to see if the numbers conform. If not, they can try to figure out what model of inheritance a trait does follow. See the trait table at the end of this document for the inheritance patterns of each trait.

Choose My Own Aliens

You can choose two aliens from the database to be parents. Scroll through the database to select parents. When you have chosen two parents, click the Next button to continue.

In this section of the web lab, students can choose two aliens from the database to act as new parents. They can explore the offspring of alien parents with genotypes that they choose.

The *< Prev* button moves backward through the database, while the *Next >* button moves forward. The *Print* button allows the student to see the genotype and phenotype of each alien and print out the alien if so

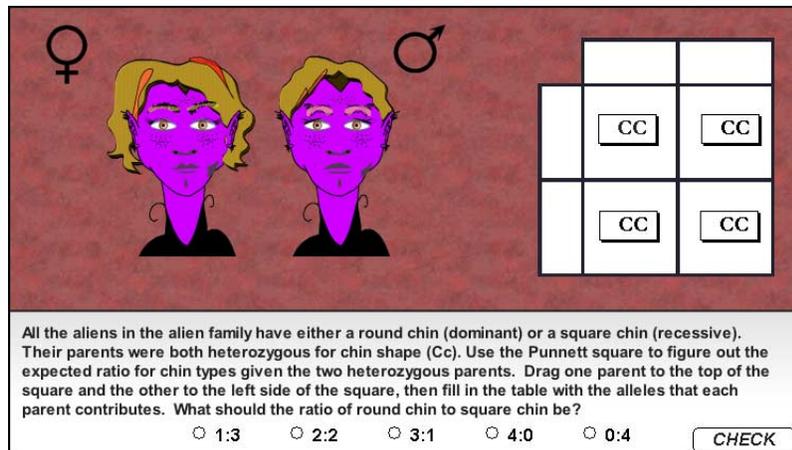

desired. After the student has selected two new parents, he or she clicks the *Next* button to begin to create an alien offspring with the chosen aliens as parents.

Each alien in the database is numbered, so that students can choose the same aliens repeatedly or multiple students in the class can choose the same alien parents. By exploring the variety of offspring produced by the pairing of two aliens, students can see how the genotypes of the parents affect the variability of the offspring. For example, if students choose a female alien with many homozygous dominant traits, the offspring should all exhibit the same phenotype for traits that show a dominant/recessive inheritance patterns.

Take the Quiz

In this quiz, students use the graphs to explore the database. By examining the numbers of alien offspring that exhibit certain phenotypes/genotypes, students try to determine the inheritance patterns of particular traits.

Question 1

All the aliens in the alien family have either a round chin (dominant) or a square chin (recessive). Their parents were both heterozygous for chin shape (Cc). Use the Punnett square to figure out the expected ratio for chin types given the two heterozygous parents. Drag one parent to the top of the square and the other to the left side of the square, then fill in the table with the alleles that each parent contributes. What should the ratio of round chin to square chin be?

1:3 2:2 3:1 4:0 0:4

All the aliens in the alien family have either a round chin (dominant) or a square chin (recessive). Their parents were both heterozygous for chin shape (Cc). Use the Punnett square to figure out the expected ratio for chin types given the two heterozygous parents. Drag one parent to the top of the square and the other to the left side of the square, then fill in the table with the alleles that each parent contributes. What should

the ratio of round chin to square chin be?

Using the Punnett square, students should discover that the ratio should be three round chins (CC, Cc, cC) to one square chin (cc).

Question 2

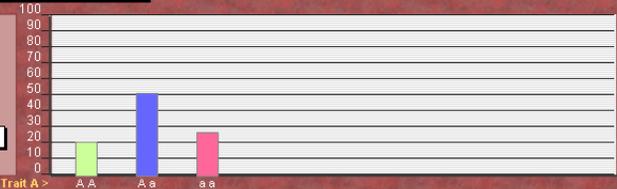

Number of aliens in the database: 100

Trait A Face Shape(A)

Genotype

Bar

Number of Traits: 1

| Genotype | Number of Aliens |
|----------|------------------|
| AA | 15 |
| Aa | 45 |
| aa | 20 |

Now let's look at the actual numbers. Use the pulldown menus to make a graph showing the numbers of round chinned and square chinned offspring that are in the database of alien family members. Then compute the approximate ratio of round chinned to square chinned offspring. Click on the selection that is closest to the actual ratio, then click Check. Does the actual ratio match the expected ratio (3:1)? Why do you think it does or doesn't?

1:3 2:2 3:1 4:0 0:4

does or doesn't?

Students will have to select the chin shape trait from the pulldown menu and then change the display to phenotype to see the ratio.

Question 3

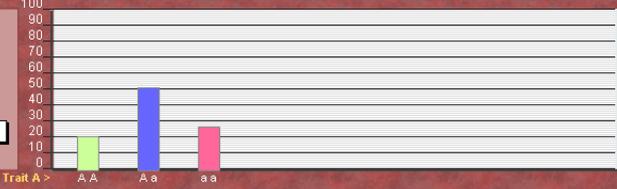

Number of aliens in the database: 100

Trait A Face Shape(A)

Genotype

Bar

Number of Traits: 1

| Genotype | Number of Aliens |
|----------|------------------|
| AA | 15 |
| Aa | 45 |
| aa | 20 |

Based on the numbers of offspring with free earlobes and the number with attached earlobes, which trait do you think is dominant? (Hint: You probably want to explore the ratios of earlobe phenotypes to answer this question.)

Free Earlobes Attached Earlobes

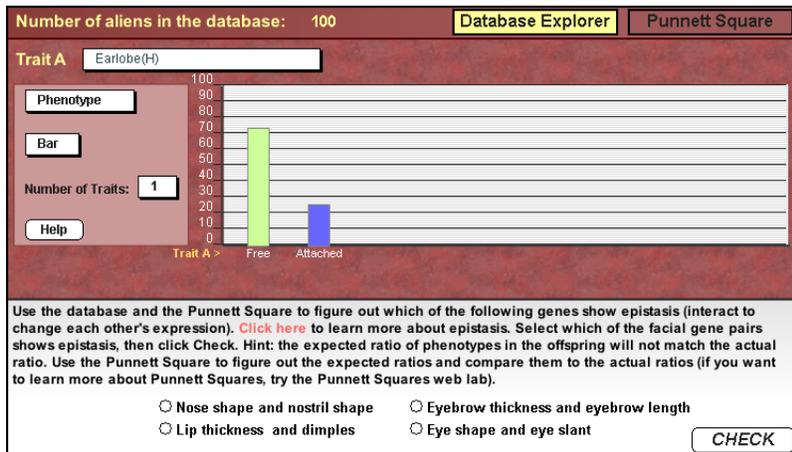

about three to one, suggesting that free earlobes are dominant to attached earlobes in the alien population.

Now let's look at the actual numbers. Use the pulldown menus to make a graph showing the numbers of square chinned and round chinned offspring that are in the database of alien family members. Then compute the approximate ratio of square chinned to round chinned offspring. Click on the selection that is closest to the actual ratio, then click Check. Does the actual ratio match the expected ratio (3:1)? Why do you think it

Based on the numbers of offspring with free earlobes and the number with attached earlobes, which trait do you think is dominant? (Hint: You probably want to explore the ratios of earlobe phenotypes to answer this question.)

To answer this question, students should make a graph of the phenotypes of the trait labeled Earlobe (H). If they do so, they should find that the ratio of Free to Attached is

Question 4

Use the database and the Punnett Square to figure out which of the following genes show epistasis (interact to change each other's expression). Click here to learn more about epistasis. Select which of the facial gene pairs shows epistasis, then click Check. Hint: the expected ratio of phenotypes in the offspring will not match the actual ratio. Use the Punnett Square to figure out the expected ratios and compare them to the actual ratios (if you want to learn

more about Punnett Squares, try the Punnett Squares web lab).

Students can explore the expected Punnett Square for each pair of traits by clicking on the Punnett Square button in the upper right hand corner of the screen. By determining what the expected ratio should be and comparing it to the actual ratio, they should be able to determine that the eyebrow thickness trait and the eyebrow length trait are an example of epistasis. The actual ratio of phenotypes should be:

- ◆ 9 bushy, unconnected eyebrows (Z?A?)
- ◆ 3 bushy, connected eyebrows (Z?aa)
- ◆ 3 fine, unconnected eyebrows (zzA?)
- ◆ 1 fine, connect eyebrow (zzaa)

Students should recognize from the graph that none of the offspring in the database has bushy, connected eyebrows. They can also look at the eyebrow length trait alone and should see that there are too few offspring with connected eyebrows if the trait follows a dominant/recessive pattern of inheritance.

Glossary

Epistasis

The suppression of a gene by the effect of an unrelated (epistatic) gene.

Heterozygous

Having two different alleles for a given trait.

Homozygous

Having the same alleles for a given trait.

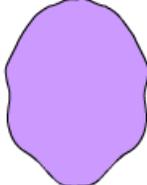

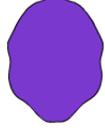

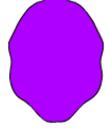

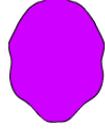

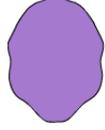

Genotype

The particular genetic pattern seen in the DNA of an individual.

Traits

Distinguishing characteristics.

Trait Table

| | Trait | Dominant Expression | | | | Recessive Expression | | |
|----|---|--|---|---|---|---|---|--|
| 1. | Face shape (A) <i>This trait shows a dominant/recessive inheritance pattern. The round face trait is dominant to the square face trait.</i> | Rounded (AA, Aa)  | | | | Square (aa)  | | |
| 2. | Chin size (B) <i>This trait shows a dominant/recessive inheritance pattern. The prominent chin trait is dominant to the less prominent chin trait.</i> | Very prominent (BB, Bb)  | | | | Less prominent (bb)  | | |
| 3. | Chin shape (C) <i>This trait shows a dominant/recessive inheritance pattern. The round chin trait is dominant to the square chin trait.</i> | Round (CC, Cc)  | | | | Square (cc)  | | |
| 4. | Cleft chin (D) <i>This trait shows a dominant/recessive inheritance pattern. The presence of a cleft chin is dominant to the absence of a cleft chin.</i> | Present (DD, Dd)  | | | | Absent (dd)  | | |
| 5. | Skin color (polygenic E, F, G) <i>This trait shows a polygenic inheritance pattern, meaning that the interaction of several genes is responsible for determining phenotype. For skin color, there are three genes. The more dominant alleles there are, the darker the skin will be.</i> | 6 dominant alleles  | 5 dominant alleles  | 4 dominant alleles  | 3 dominant alleles  | 2 dominant alleles  | 1 dominant alleles  | 0 dominant allele  |

| | | | | | | | | | | |
|-----|--|------------------------------|--------------------------|-------------------------------------|-------------------------------|----------------------------|--------------------------|----------------------------|--------------------------|--------------------------|
| 6. | <p>Hair color (polygenic H, I, J, K)</p> <p><i>This trait shows a polygenic inheritance pattern meaning that the interaction of several genes is responsible for determining phenotype. For hair color there are four genes. The more dominant alleles there are, the darker the hair will be.</i></p> | 8 dominant alleles | 7 dominant alleles | 6 dominant alleles | 5 dominant alleles | 4 dominant alleles | 3 dominant alleles | 2 dominant alleles | 1 dominant alleles | 0 dominant alleles |
| 7. | <p>Red tints in hair (L)</p> <p><i>This trait shows an incomplete dominance inheritance pattern. The red tints trait is also an example of epistasis. Red tints are only visible in aliens with hair that is light brown or lighter in color.</i></p> | Dark red tint (L_1, L_1) | | | Light red tint (L_1, L_2) | | | No red tint (L_2, L_2) | | |
| 8. | <p>Hair type (M)</p> <p><i>This trait shows an incomplete dominance inheritance pattern. Curly hair is dominant, wavy hair is the intermediate phenotype, and straight hair is the recessive phenotype.</i></p> | Curly (M_1, M_1) | | Wavy (M_1, M_2) | | Straight (M_2, M_2) | | | | |
| 9. | <p>Widow's peak (O)</p> <p><i>This trait shows a dominant/recessive inheritance pattern. The presence of a widow's peak is dominant to the absence of one.</i></p> | Present (OO, Oo) | | | | Absent (oo) | | | | |
| 10. | <p>Eye color (polygenic P, Q)</p> <p><i>This trait shows a polygenic inheritance pattern meaning that the interaction of several genes is responsible for determining phenotype. For eye color, there are two genes.</i></p> | black (PPQQ) | dark brown (PPQq) | brown & green tints (PpQQ) | brown (PpQq) | violet (PPqq) | gray blue (Ppqq) | green (ppQQ) | dark blue (ppQq) | light blue (ppqq) |
| 11. | <p>Eye distance (R_1, R_2)</p> <p><i>This trait shows an incomplete dominance</i></p> | Close (R_1, R_1) | | | Average (R_1, R_2) | | | Distant (R_2, R_2) | | |

| | | | | |
|-----|---|--|---|--|
| | <i>inheritance pattern. Close set eyes are dominant.</i> | | | |
| 12. | <p>Eye size (S_1, S_2)</p> <p><i>This trait shows an incomplete dominance inheritance pattern. Large eyes are dominant, medium eyes are intermediate and small eyes are recessive.</i></p> | <p>Large (S_1, S_1)</p>  | <p>Medium (S_1, S_2)</p>  | <p>Small (S_2, S_2)</p>  |
| 13. | <p>Eye shape (T)</p> <p><i>This trait shows a dominant/recessive inheritance pattern. Almond-shaped eyes are dominant to round eyes.</i></p> | <p>Almond (TT, Tt)</p>  | | <p>Round (tt)</p>  |
| 14. | <p>Eye slant (U)</p> <p><i>This trait shows a dominant/recessive inheritance pattern. Horizontal eyes are dominant to upward slanting eyes.</i></p> | <p>Horizontal (UU, Uu)</p>  | | <p>Upward (uu)</p>  |
| 15. | <p>Eyelashes (V)</p> <p><i>This trait shows a dominant/recessive inheritance pattern. Long eyelashes are dominant to short ones.</i></p> | <p>Long (VV, Vv)</p>  | | <p>Short (vv)</p>  |
| 16. | <p>Eyebrow color (W_1, W_2)</p> <p><i>This trait shows an incomplete dominance inheritance pattern. Eyebrows that are darker than the hair are dominant. Those that are the same color as the hair are the intermediate trait, while those that are lighter than the hair are recessive.</i></p> | <p>Darker than hair (W_1, W_1)</p>  | <p>Same as hair (W_1, W_2)</p>  | <p>Lighter than hair (W_2, W_2)</p>  |
| 17. | <p>Eyebrow thickness (Z)</p> <p><i>This trait shows a dominant/recessive inheritance pattern. Bushy eyebrows are dominant to fine ones.</i></p> | <p>Bushy (ZZ, Zz)</p>  | | <p>Fine (zz)</p>  |

| | | | | |
|---|--|--|---|--|
| <p>18. Eyebrow length (A)</p> <p><i>This trait shows a dominant/recessive inheritance pattern. Unconnected eyebrows are dominant to connected ones. Eyebrow length also shows epistasis – connected eyebrows are only seen in aliens with fine eyebrows.</i></p> | <p>Not connected (AA, Aa)</p>  | | <p>Connected (aa)</p>  | |
| <p>19. Mouth size (B₁, B₂)</p> <p><i>This trait shows an incomplete dominance inheritance pattern. A long mouth is dominant, a medium-sized mouth, intermediate, while a small mouth is recessive.</i></p> | <p>Long (B₁, B₁)</p>  | <p>Medium (B₁, B₂)</p>  | <p>Short (B₂, B₂)</p>  | |
| <p>20. Lip thickness (C)</p> <p><i>This trait shows a dominant/recessive inheritance pattern. Thick lips are dominant to thin lips.</i></p> | <p>Thick (CC, Cc)</p>  | | <p>Thin (cc)</p>  | |
| <p>21. Dimples (D)</p> <p><i>This trait shows a dominant/recessive inheritance pattern. The presence of dimples is dominant to their absence.</i></p> | <p>Present (DD, Dd)</p>  | | <p>Absent (dd)</p>  | |
| <p>22. Nose size (E₁, E₂)</p> <p><i>This trait shows an incomplete dominance inheritance pattern. A large nose is dominant, a medium-sized nose, intermediate, and a small nose, recessive.</i></p> | <p>Large (E₁, E₁)</p>  | <p>Medium (E₁, E₂)</p>  | <p>Small (E₂, E₂)</p>  | |
| <p>23. Nose shape (F)</p> <p><i>This trait shows a dominant/recessive inheritance pattern. A rounded nose is dominant to a pointed nose.</i></p> | <p>Rounded (FF, Ff)</p>  | | <p>Pointed (ff)</p>  | |

| | | |
|--|---|--|
| <p>24. Nostril shape (G)</p> <p><i>This trait shows a dominant/recessive inheritance pattern. Rounded nostrils are dominant to pointed ones.</i></p> | <p>Rounded (GG, Gg)</p>  | <p>Pointed (gg)</p>  |
| <p>25. Earlobe attachment (H)</p> <p><i>This trait shows a dominant/recessive inheritance pattern. Free earlobes are dominant to attached earlobes.</i></p> | <p>Free (HH, Hh)</p>  | <p>Attached (hh)</p>  |
| <p>26. Darwin's earpoint (I)</p> <p><i>This trait shows a dominant/recessive inheritance pattern. The presence of Darwin's earpoints is dominant to their absence.</i></p> | <p>Present (II, Ii)</p>  | <p>Absent (ii)</p>  |
| <p>27. Earpits (J)</p> <p><i>This trait shows a dominant/recessive inheritance pattern. The presence of earpits is dominant to their absence.</i></p> | <p>Present (JJ, Jj)</p>  | <p>Absent (jj)</p>  |
| <p>28. Hairy ears (K)</p> <p><i>This trait shows a dominant/recessive inheritance pattern. Hairy ears are dominant to ears without hair.</i></p> | <p>Present (KK, Kk)</p>  | <p>Absent (kk)</p>  |

| | | | |
|-----|---|---|--|
| 29. | <p>Freckles on cheeks (L)</p> <p><i>This trait shows a dominant/recessive inheritance pattern. The presence of freckles on the cheeks is dominant to their absence.</i></p> | <p>Present (LL, Ll)</p>  | <p>Absent (ll)</p>  |
| 30. | <p>Freckles on forehead (M)</p> <p><i>This trait shows a dominant/recessive inheritance pattern. The presence of freckles on the forehead is dominant to their absence.</i></p> | <p>Present (MM, Mm)</p>  | <p>Absent (mm)</p>  |
